# E-COMMERCE System Requirements Specification

# **BACKEND-EXPRESS RESTFUL APPLICATION**

### 1 PROJECT ABSTRACT

"E-Commerce" is an express js application designed to provide a seamless online shopping through products, cart and order management APIs with authentication enabled. It leverages the ExpressJs with MongoDB as the database. This platform aims to provide APIs on the management of products, cart and order, allowing users to browse, search for, and purchase a wide range of products.

#### Following is the requirement specifications:

|                 | E-Commerce |
|-----------------|------------|
|                 |            |
| Modules         |            |
| 1               | Product    |
| 2               | Order      |
| 3               | Middleware |
|                 |            |
| Product Module  |            |
| Functionalities |            |

| Product Module  |                        |
|-----------------|------------------------|
| Functionalities |                        |
|                 |                        |
| 1               | Get all products       |
| 2               | Create a new product   |
| 3               | Search the products    |
| 4               | Get top rated products |
| 5               | Apply discount on cart |
| 6               | View the cart          |
| 7               | Add item to the cart   |
| 8               | Checkout the cart      |
| 9               | Update an item in cart |
| 10              | Remove an item in cart |
| 11              | Get a product          |
| 12              | Update a product       |
| 13              | Delete a product       |

| Order Module    |  |
|-----------------|--|
| Functionalities |  |
|                 |  |
| 1               | Get all orders   |
| 2               | Create an order  |
| 3               | Get order by id  |
| 4               | Update an order it's id  |
| 5               | Delete an order by it's id   |
| 6               | Get order for user   |
| 7               | Cancel any order   |
| 8               | Get the payment details of any order   |
| 9               | Process the payment for any order  |
| 10              | Get the analytics of orders with data for totalOrders, average order amount, highest and lowest order amount |
| 11              | Generate the invoice for any order with order id, order date and total amount details                        |
| 12              | Track the order shipment by returning status and tracking number   |
| 13              | Get the revenue analytics which returns the total, highest and lowest revenue                                |
| 14              | Check whether the product is ordered or not  |

| Middleware      |  |
|-----------------|--|
| Module          |  |
| Functionalities |  |
|                 |  |
| 1               | Implement logic to check and validate token in authUserMiddlware file. |
| 2               | Implement logic to check whether a logged in user is admin or not in   |
|                 | authAdminMiddleware.   |

### 2 ASSUMPTIONS, DEPENDENCIES, RISKS / CONSTRAINTS

### 2.1 ORDER CONSTRAINTS

- 1. When creating an order userId, product, totalAmount, paymentDetails and shipmentDetails are mandatory fields, on failing it should throw a custom exception with message as "Failed to create order.".
- 2. When fetching an order by ID, if the order ID does not exist, the operation should throw a custom exception with message as "Order not found.".
- 3. When updating an order, if the order ID does not exist, the operation should throw a custom exception with message as "Order not found.".
- 4. When removing an order, if the order ID does not exist, the operation should throw a custom exception with message as "Order not found.".
- 5. When canceling an order, if the order ID does not exist, it should throw a custom exception with message as "Order not found.".
- 6. When fetching payment details for an order, if the order ID does not exist, it should throw a custom exception with message as "Order not found.".
- 7. When processing the payment for an order, if the order ID does not exist, it should throw a custom exception with message as "Order not found.".
- 8. When generating an invoice for an order, if the order ID does not exist, it should throw a custom exception with message as "Order not found.".
- 9. When tracking an order, if the order ID does not exist, it should throw a custom exception with message as "Order not found.".

### 2.2 PRODUCT CONSTRAINTS

- 1. When creating product name and price are mandatory fields, on failing it should throw a custom exception with message as "Failed to create product.".
- 2. When fetching a product by ID, if the product ID does not exist, the operation should throw a custom exception with message as "Product not found.".
- 3. When updating a product, if the product ID does not exist, the operation should throw a custom exception with message as "Product not found.".
- 4. When removing a product, if the product ID does not exist, the operation should throw a custom exception with message as "Product not found.".

- 5. When searching a product, if the name or description does not exist, it should throw a custom exception with message as "Failed to search for products.".
- 6. When applying some discount on a product, if the discount percentage is invalid (0 > discount or discount > 100), it should throw a custom exception with message as "Invalid discount percentage.".
- 7. When applying some discount on a product, if the discount percentage does not exist, it should throw a custom exception with message as "Failed to apply discount.".
- 8. When checking out a cart, if the payment method and address does not exist, it should throw a custom exception with message as "Failed to complete checkout.".
- 9. When adding a product in cart, if the user, product, quantity and price does not exist, it should throw a custom exception with message as "Failed to add products to the cart.".
- 10. When fetching cart details, if the user does not exist, it should throw a custom exception with message as "Failed to view the contents of the cart.".
- 11. When updating a cart item, if the user, item and quantity does not exist, it should throw a custom exception with message as "Failed to update item in the cart.".
- 12. When removing an item from the cart, if the user and item does not exist, it should throw a custom exception with message as "Failed to remove item from the cart.".

### **Common Constraints**

- All the database operations must be implemented in serviceImpl file only.
- Do not change, add, remove any existing methods in the service file.
- In the service layer, custom methods can be added as per requirements.
- All RestEndpoint methods and Exception Handlers must return data in json format.
- Any type of authentication and authorisation must be added in routes file only.

### 3 REST ENDPOINTS

Return

Rest End-points to be exposed in the routes file and attached with controller method along with method details for the same to be created. Please note, that these all are required to be implemented.

# 3.1 ORDER RESTPOINTS

| Note: All order routes must be authenticated and only accessible on valid token. |                     |                                |  |  |
|--|---------------------|--------------------------------|--|--|

### 4 TEMPLATE CODE STRUCTURE

### 4.1 Products code structure

### 1) MODULES/PRODUCTS: controller

**Resources** 

| ProductController | This is the controller class for | To be       |
|-------------------|----------------------------------|-------------|
| (Class)           | the product module.              | implemented |

### 2) MODULES/PRODUCTS: dao

#### Resources

| File                   | Description                  | Status              |
|------------------------|------------------------------|---------------------|
| models/cart model      | Models for eart and product  | Already implemented |
| models/product model   | Models for cart and product  | Alleddy Implemented |
| schemas/cart schema    | Schemas for cart and product | Already implemented |
| schemas/product schema |                              |                     |

### 3) MODULES/PRODUCTS: routes

#### **Resources**

| File           | Description        | Status                 |
|----------------|--------------------|------------------------|
| Product routes | Routes for product | Partially implemented. |

### 4) MODULES/PRODUCTS: service

#### **Resources**

| Class          | Description            | Status               |
|----------------|------------------------|----------------------|
| ProductService | Defines ProductService | Already implemented. |

# 5) MODULES/PRODUCTS: service/impl

#### **Resources**

| Class              | Description                                    | Status             |  |
|--------------------|--|--------------------|--|
| ProductServiceImpl | <ul> <li>Implements ProductService.</li> </ul> | To be implemented. |  |

.

### 4.2 Orders code structure

### 1) MODULES/ORDER: controller

**Resources** 

| OrderController | This is the controller class for | To be       |
|-----------------|----------------------------------|-------------|
| (Class)         | the order module.                | implemented |

### 2) MODULES/ORDER: dao

#### Resources

| File                 | Description      | Status              |
|----------------------|------------------|---------------------|
| models/order model   | Model for order  | Already implemented |
| schemas/order schema | Schema for order | Already implemented |

### 3) MODULES/ORDER: routes

#### **Resources**

| File         | Description      | Status                 |
|--------------|------------------|------------------------|
| Order routes | Routes for order | Partially implemented. |

# 4) MODULES/ORDER: service

#### **Resources**

| plemented. |
|------------|
|            |
|            |

# 5) MODULES/ORDER: service/impl

#### Resources

| Class            | Description                                  | Status             |
|------------------|--|--------------------|
| OrderServiceImpl | <ul> <li>Implements OrderService.</li> </ul> | To be implemented. |

### **5 METHOD DESCRIPTIONS**

# 5.1 PRODUCT - Method Descriptions:

1. ProductController Class - Method Descriptions(Based on Route Mapping):

| Method        | Task                        | Implementation Details  |
|---------------|-----------------------------|---|
| createProduct | To create a new product     | - The request type should be POST with URL /api/products/create Requires authentication and admin privileges Call productService.createProduct(req.body) Return 201 status with created product On error, respond with 500 and message: 'Failed to create product.' |
| getProduct    | To retrieve a product by ID | <ul> <li>The request type should be GET with URL /api/products/:id.</li> <li>Call productService.getProduct(req.params.id).</li> <li>Return the product.</li> <li>On error, respond with 404 and message: 'Product not found.'</li> </ul>                           |
| updateProduct | To update a product by ID   | - The request type should be PUT with URL /api/products/:id Call productService.updateProduct(req.params.id, req.body) Return the updated product On error, respond with 404 and message: 'Product not found.'  |

| deleteProduct       | To delete a product by ID              | - The request type should be DELETE with URL /api/products/:id Requires authentication and admin privileges Call productService.deleteProduct(req.params.id) Return the deleted product On error, respond with 404 and message: 'Product not found.'       |
|---------------------|--|--|
| getAllProducts      | To fetch all products                  | - The request type should be GET with URL /api/products/all Call productService.getAllProducts() Return all products On error, respond with 500 and message: 'Failed to retrieve products.'  |
| getTopRatedProducts | To get top-rated products with limit   | - The request type should be GET with URL /api/products/top-rated/:limit Requires authentication Call productService.getTopRatedProducts(limit) Return top-rated products On error, respond with 500 and message: 'Failed to retrieve top rated products.' |
| searchProduct       | To search products by name/description | - The request type should be GET with URL /api/products/search Call productService.searchProduct(name, description) Return matching products On error, respond with 500 and message: 'Failed to search products.'  |
| applyDiscount       | To apply discount for a user's cart    | - The request type should be POST with URL /api/products/discount/:userId Requires authentication Call productService.applyDiscount(userId, discountPercentage) Return discount result On error, respond with 500 and message: 'Failed to apply discount.' |
| checkoutCart        | To checkout a user's cart              | - The request type should be POST with URL /api/products/cart/checkout/:userId Requires authentication Call productService.checkoutCart(userId, paymentMethod, address) Return checkout result.  |

|                |                                       | - On error, respond with 500 and message: 'Failed to  |
|----------------|---------------------------------------|---|
|                |                                       | checkout cart.'   |
| addToCart      | To add a product to a user's cart     | - The request type should be POST with URL /api/products/cart/add/:userId Requires authentication Call productService.addToCart(userId, productId, quantity, price) Return updated cart On error, respond with 500 and message: 'Failed to add to cart.'            |
| viewCart       | To view the contents of a user's cart | - The request type should be GET with URL /api/products/cart/:userId Requires authentication Call productService.viewCart(userId) Return cart details On error, respond with 500 and message: 'Failed to view cart.'  |
| updateCartItem | To update quantity of a cart item     | - The request type should be PUT with URL /api/products/cart/update/:userId/:itemId Requires authentication Call productService.updateCartItem(userId, itemId, quantity) Return update result On error, respond with 500 and message: 'Failed to update cart item.' |
| removeCartItem | To remove an item from a cart         | - The request type should be DELETE with URL /api/products/cart/remove/:userId/:itemId Requires authentication Call productService.removeCartItem(userId, itemId) Return removal result On error, respond with 500 and message: 'Failed to remove cart item.'       |

# 2. ProductServiceImpl Class - Method Descriptions:

| Method              | Task  | Implementation Details   |
|---------------------|---|--|
| createProduct       | To create a new product                             | <ul> <li>- Accept product data and create a new product using Product.create().</li> <li>- Return the newly created product.</li> <li>- On error, throw: 'Failed to create product.'</li> </ul>  |
| getProduct          | To retrieve a product by its ID                     | <ul> <li>- Use Product.findById(productId).</li> <li>- If not found, throw: 'Product not found.'</li> <li>- Return the found product.</li> <li>- On error, throw: 'Failed to get product.'</li> </ul>  |
| updateProduct       | To update an existing product by ID                 | <ul> <li>- Use Product.findByIdAndUpdate(productId, updatedProduct, { new: true }).</li> <li>- If not found, throw: 'Product not found.'</li> <li>- Return the updated product.</li> <li>- On error, throw: 'Failed to update product.'</li> </ul> |
| deleteProduct       | To delete a product by                              | - Use Product.findByIdAndDelete(productId) If not found, throw: 'Product not found.' - Return the deleted product On error, throw: 'Failed to delete product.'   |
| searchProduct       | To search products based on name and/or description | <ul> <li>Build query object using regex for name and description fields.</li> <li>Use Product.find(query) to search.</li> <li>Return the list of matching products.</li> <li>On error, throw: 'Failed to search for products.'</li> </ul>          |
| getTopRatedProducts | To retrieve top-rated products up to a limit        | <ul> <li>- Use Product.find().sort({ ratings: -1 }).limit(limit).</li> <li>- Return the list of top-rated products.</li> <li>- On error, throw: 'Failed to get top rated products.'</li> </ul>   |
| getAllProducts      | To retrieve all products                            | <ul><li>Use Product.find() to retrieve all products.</li><li>Return the list of all products.</li><li>On error, throw: 'Failed to get all products.'</li></ul>   |

| applyDiscount  | To apply a discount to all products in the user's cart | <ul> <li>- Validate the cart and discount percentage.</li> <li>- Apply discount to item prices and save the cart.</li> <li>- Return a success message.</li> <li>- On error, throw: 'Failed to apply discount.'</li> </ul>  |
|----------------|--|--|
| checkoutCart   | To place an order and clear the cart                   | <ul> <li>Retrieve user's cart and calculate total amount.</li> <li>Find cart as per userId, if not found throw "Cart not found.".</li> <li>Delete the user's cart.</li> <li>Return a success message and the created order ID.</li> <li>On error, throw: 'Failed to complete checkout.'</li> </ul> |
| addToCart      | To add a product to a user's cart                      | <ul> <li>If item exists, increment quantity.</li> <li>Else, add new item to the cart using \$addToSet.</li> <li>Return the updated cart.</li> <li>On error, throw: 'Failed to add products to the cart.'</li> </ul>  |
| viewCart       | To view a user's cart and product details              | - Use Cart.findOne({ userId }).populate('items.product') Return the user's cart with product details On error, throw: 'Failed to view the contents of the cart.'   |
| updateCartItem | To update quantity of a cart item                      | <ul> <li>- Use Cart.findOneAndUpdate() with itemId and quantity.</li> <li>- Return the updated cart.</li> <li>- On error, throw: 'Failed to update item in the cart.'</li> </ul>   |
| removeCartItem | To remove an item from the cart                        | - Use \$pull to remove item by itemId.  - Return the updated cart.  - On error, throw: 'Failed to remove item from the cart.'  |

# 5.2 ORDER - Method Descriptions:

# 1. OrderController Class - Method Descriptions(Based on Route Mapping):

| Method       | Task                              | Implementation Details   |
|--------------|-----------------------------------|--|
| getAllOrders | To retrieve all orders            | <ul> <li>- The request type should be GET with URL /api/orders/all.</li> <li>- Requires authentication.</li> <li>- Call orderService.getAllOrders(req.body).</li> <li>- Return list of all orders.</li> <li>- On error, respond with 500 and message: 'Failed to create order.'</li> </ul> |
| createOrder  | To create a new order             | - The request type should be POST with URL /api/orders/create Call orderService.createOrder(req.body) Return the created order with status 201 On error, respond with 500 and message: 'Failed to create order.'   |
| getOrder     | To get a specific order by ID     | - The request type should be GET with URL /api/orders/:id Call orderService.getOrder(req.params.id) Return the order On error, respond with 404 and message: 'Order not found.'  |
| updateOrder  | To update an existing order by ID | - The request type should be PUT with URL /api/orders/:id Call orderService.updateOrder(req.params.id, req.body) Return the updated order On error, respond with 404 and message: 'Order not found.'   |
| deleteOrder  | To delete an order by ID          | <ul> <li>The request type should be DELETE with URL /api/orders/:id.</li> <li>Call orderService.deleteOrder(req.params.id).</li> <li>Return the deleted order.</li> <li>On error, respond with 404 and message: 'Order not found.'</li> </ul>  |

| getUserOrders     | To get all orders placed<br>by a specific user | - The request type should be GET with URL /api/orders/user/:userId Call orderService.getUserOrders(userId) Return list of user orders On error, respond with 500 and message: 'Failed to retrieve user orders.'   |
|-------------------|--|---|
| cancelOrder       | To cancel a specific<br>order by ID            | - The request type should be DELETE with URL /api/orders/cancel/:id Call orderService.cancelOrder(orderId) Return the canceled order On error, respond with 404 and message: 'Order not found.'   |
| getPaymentDetails | To retrieve payment details of an order        | - The request type should be GET with URL /api/orders/:id/payment Call orderService.retrievePaymentDetails(orderId) Return payment details On error, respond with 404 and message: 'Order not found.'   |
| processPayment    | To process payment for a specific order        | - The request type should be POST with URL /api/orders/:id/pay Call orderService.processPayment(orderId) Return success message "Payment processed successfully." On error, respond with 500 and message: 'Failed to process payment.'                          |
| getOrderAnalytics | To retrieve analytics on orders                | <ul> <li>The request type should be GET with URL /api/orders/analytics.</li> <li>Call orderService.getOrderAnalytics().</li> <li>Return order analytics data.</li> <li>On error, respond with 500 and message: 'Failed to retrieve order analytics.'</li> </ul> |
| generateInvoice   | To generate invoice for an order               | - The request type should be GET with URL /api/orders/:id/invoice Call orderService.generateInvoice(orderId) Return invoice details On error, respond with 500 and message: 'Failed to generate invoice.'   |

| trackShipment       | To track shipment of an order                     | <ul> <li>The request type should be GET with URL /api/orders/:id/shipment.</li> <li>Call orderService.trackShipment(orderId).</li> <li>Return shipment tracking details.</li> <li>On error, respond with 500 and message: 'Failed to track shipment.'</li> </ul>                          |
|---------------------|---|---|
| getRevenueAnalytics | To retrieve revenue analytics                     | <ul> <li>The request type should be GET with URL</li> <li>/api/orders/revenue.</li> <li>Call orderService.getRevenueAnalytics().</li> <li>Return revenue analytics data.</li> <li>On error, respond with 500 and message: 'Failed to retrieve revenue analytics.'</li> </ul>              |
| hasOrderedProduct   | To check if a user has ordered a specific product | - The request type should be GET with URL /api/orders/ordered/:userId/:productId Call orderService.hasOrderedProduct(userId, productId) Return boolean value or relevant result On error, respond with 500 and message: 'Failed to retrieve information about this product for this user' |

# 2. OrderServiceImpl Class - Method Descriptions:

| Method       | Task                               | Implementation Details  |
|--------------|------------------------------------|---|
| createOrder  | To create a new order              | <ul><li>- Accept order data and create the order using Order.create().</li><li>- Return the created order.</li><li>- On error, throw: 'Failed to create order.'</li></ul> |
| getAllOrders | To retrieve all orders             | <ul><li>- Use Order.find() to fetch all orders.</li><li>- Return list of all orders.</li><li>- On error, throw: 'Failed to fetch all orders.'</li></ul>                   |
| getOrder     | To retrieve a specific order by ID | - Use Order.findById(orderId) If not found, throw: 'Order not found.' - Return the found order On error, throw: 'Failed to get order.'                                    |

| updateOrder              | To update an existing order by ID                | - Use Order.findByIdAndUpdate(orderId, updatedOrder, { new: true }) If not found, throw: 'Order not found.' - Return the updated order On error, throw: 'Failed to update order.'  |
|--------------------------|--|--|
| deleteOrder              | To delete an order by ID                         | - Use Order.findByIdAndDelete(orderId) If not found, throw: 'Order not found.' - Return the deleted order On error, throw: 'Failed to delete order.'   |
| getUserOrders            | To retrieve all orders placed by a specific user | <ul><li>- Use Order.find({ userId }) to retrieve user's orders.</li><li>- Return list of user's orders.</li><li>- On error, throw: 'Failed to retrieve user orders.'</li></ul>   |
| cancelOrder              | To cancel an order by ID                         | <ul> <li>- Use Order.findByIdAndDelete(orderId).</li> <li>- If not found, throw: 'Order not found.'</li> <li>- Return the canceled order.</li> <li>- On error, throw: 'Failed to cancel order.'</li> </ul>   |
| retrieve Payment Details | To get payment details of a specific order       | - Use Order.findById(orderId, 'payment') If not found, throw: 'Order not found.' - Return the payment details On error, throw: 'Failed to retrieve payment details.'   |
| processPayment           | To mark the order as paid                        | <ul> <li>- Use Order.findByld(orderId), set payment status and transactionId.</li> <li>- Save the order.</li> <li>- Return success message as "Payment processed successfully.".</li> <li>- On error, throw: 'Failed to process payment.'</li> </ul> |
| getOrderAnalytics        | To compute analytics<br>based on all orders      | - Calculate total, average, highest and lowest order amounts Return order analytics object On error, throw: 'Failed to retrieve order analytics.'  |

| generateInvoice     | To generate invoice<br>data for an order               | <ul> <li>- Use Order.findById(orderId) to get order details.</li> <li>- If not found, throw: 'Order not found.'</li> <li>- Return basic invoice details.</li> <li>- On error, throw: 'Failed to generate invoice.'</li> </ul> |
|---------------------|--|---|
| trackShipment       | To provide tracking details for an order               | - Use Order.findById(orderId) If not found, throw: 'Order not found.' - Return static shipment tracking information On error, throw: 'Failed to track shipment.'  |
| getRevenueAnalytics | To compute revenue statistics from all orders          | <ul> <li>Calculate total, highest, and lowest revenue from Order data.</li> <li>Return revenue analytics object.</li> <li>On error, throw: 'Failed to retrieve revenue analytics.'</li> </ul>                                 |
| hasOrderedProduct   | To check if a user has ever ordered a specific product | <ul><li>- Use Order.findOne with user and product conditions.</li><li>- Return true if order exists, otherwise false.</li><li>- On error, return false.</li></ul>   |

# 5.3 MIDDLEWARE - Method Descriptions:

# 1. AuthAdminMiddleware - Method Descriptions:

| Middleware      | Purpose  | Implementation Details  |
|-----------------|--|---|
| adminMiddleware | To restrict access to routes that require admin privileges | - This middleware checks if req.user.isAdmin equals 1 If true, it allows the request to proceed by calling next() If false, it returns a 403 Forbidden status with the message: 'Access forbidden. Admin privileges required.' - Return: Continues to next middleware or route if authorized; otherwise, returns an error response. |

### 2. AuthUserMiddleware - Method Descriptions:

| Middleware     | Purpose                                 | Implementation Details   |
|----------------|---|--|
| authMiddleware | To authenticate users using a JWT token | <ul> <li>Extracts the token from the 'Authorization' header.</li> <li>If token is missing, responds with 401 status and message: 'Unauthorized'.</li> <li>Verifies the token using jwt.verify with a secret key.</li> <li>If valid, sets req.user to the decoded token's user object and proceeds to the next middleware.</li> <li>If invalid or expired, responds with 401 status and message: 'Unauthorized'.</li> <li>Return: Proceeds with the request if token is valid; otherwise, returns an error response.</li> </ul> |

### **EXECUTION STEPS TO FOLLOW FOR BACKEND**

- 1. All actions like build, compile, running application, running test cases will be through Command Terminal.
- To open the command terminal the test takers, need to go to
   Application menu (Three horizontal lines at left top) -> Terminal ->New Terminal.
- 3. This editor Auto Saves the code.
- 4. These are time bound assessments the timer would stop if you logout and while logging in back using the same credentials the timer would resume from the same time it was stopped from the previous logout.
- 5. To test any Restful application, the last option on the left panel of IDE, you can find ThunderClient, which is the lightweight equivalent of POSTMAN.
- 6. You can follow series of command to setup express environment once you are in your project-name folder:
  - a. npm install -> Will install all dependencies -> takes 10 to 15 min

- b. npm run start -> To compile and run the project.
- c. npm run jest -> to run all test cases and see the summary of all passed and failed test cases.
- d. npm run test -> to run all test cases and register the result of all test cases. It is
  mandatory to run this command before submission of workspace -> takes 5 to 6
  min
